

I am an interventional radiologist at Memorial Sloan Kettering Cancer Center, with a clinical focus on tumor embolization, radioembolization, and ablation, as well as complex venous interventions. I spent 30% of my time in the laboratory, developing new minimally invasive therapies for liver and pancreatic cancer.

Research and product development

New minimally invasive therapies for liver and pancreatic cancer. My current research focuses on developing new methods for improving tumor embolization and ablation, testing them in animals, and then translating the most promising methods into human clinical trials. The basic strategy is to make tumor embolization safer and more effective by using new intra-arterial agents and devices, and to develop methods for safely embolizing tumors outside the liver. (1742 citations, 41 papers, 48 abstracts, and 3 patent applications.)

Research web PACS. Developed a multi-institutional research web PACS with image analysis and image processing plug-ins, interactive multimedia radiology reports, and screen share. 100,000 users have viewed 10 million images on Claripacs. (collaboration with Bao Do and Michael Muelly). <http://www.claripacs.com>.

CT metal artifact reduction. Developed a patented method (MDT) for reducing metal artifacts in CT scans, which improves image quality in 86% of scans, and improves diagnosis in 14% of

scans. This method has been successfully used on hundreds of patients in 140 hospitals, including MGH, MD Anderson, and Stanford. This project involved development of a scalable cloud application, integration with PACS, and technology licensing.
